

Mindboggle

An informatics framework for open research
in quantifying the shape of the human brain

Automated brain labeling

Informatics framework

nested structures within a graph-based data model

Top: structures: surface patches fragmented by application of the Laplace-Beltrami operator, sulcus folds and subfolds, and structures within a subfold.

Bottom: schematic diagrams representing the hierarchical relationships among nested structures.

Bottom right: features as properties of edges (relationships: Part of, Connected to, Has label) and nodes (geometric, shape, spectral, and connectivity measures).

Informatics framework

graph-based database of hierarchical brain features

This graph model shows an example of how relations between basins and their labeled regions are represented for two (CUMC12) subjects. Note that basin 88 and 89 share similar labels.

Informatics framework

graph-based database: example query

Informatics framework

graph-based database: infrastructure and example query

The graph model can be queried via REST, Cypher, reXster, or Gremlin. This example shows how to query all outgoing relations from basin 88:

Gremlin query:

```
{
  "script": "g.v(88).outE"
}
```

JSON response:

```
{
  "start": "http://192.168.23.219:7474/db/data/node/88",
  "data": {
  },
  "type": "IS SIMILAR",
  "extensions": {
  },
  "end": "http://192.168.23.219:7474/db/data/node/89"
}, {
  "start": "http://192.168.23.219:7474/db/data/node/88",
  "data": {
  },
  "type": "HAS LABEL",
  "extensions": {
  },
  "end": "http://192.168.23.219:7474/db/data/node/60"
},
}
```

Shape analysis of brains

Informatics framework

Automated brain labeling

Shape analysis of brains

Informatics framework

Automated brain labeling

Automated labeling

convention: registration-based labeling

Automated labeling

convention: registration-based labeling

Step 1: compute the registration transform from the atlas to the target

Automated labeling

convention: registration-based labeling

Step 2: apply the transform to the atlas labels

Automated labeling

Mindboggle: feature-based labeling

Automated labeling

Mindboggle: feature-based labeling

Step 1: extract features

Automated labeling

Mindboggle: feature-based labeling

Step 2: match atlas and target features

Automated labeling

Mindboggle: feature-based labeling

Step 3: propagate labels within inferred label boundaries?

Automated labeling

Mindboggle: feature-based labeling

Alternative Step 3: compute image + landmark-based registration transform from atlas to target

Automated labeling

Mindboggle: feature-based labeling

Step 4: apply registration transform to atlas labels

Mindboggle open source software:

shape analysis
querying the graph-based database
interactive visualization
automated anatomical labeling

Shape analysis of brains

Informatics framework

Automated brain labeling

Mindboggle data:

>100 freely available manually labeled brain images

Multimodal Mindboggle

combine structures across modalities

A gray/white matter surface (left lateral view) with visible sulcal pits highlighted (cyan circles). These features go by different names (sulcal roots, buried or annectant gyrii, plis de passage) and may be well conserved structures formed early in development.

DTI connectivity graph (same subject). Vertices represent all extracted sulcal pits and each edge width indicates a connection probability greater than 0.01 between two vertices (and does not follow a tractography path).

Multimodal Mindboggle

clinical example

Early attempt at subgraph extraction (upper row) and matching (lower row). These graphs were constructed from (left to right) a remitter, non-remitter, and control subject. The subgraphs in red in the lower row have the highest small-worldness ratio.

Feature extraction

Forrest Bao
graduate student (Texas Tech)

Feature matching

Yrjö Häme
